📄 REAL DATA

EQUITY VALUE (MID)

₹1,281 Cr

range ₹1,049 Cr – ₹2,849 Cr

HEADLINE METHOD

EV/EBITDA

triangulated with 3 methods

PEERS USED

15

effective 13.02 · 13 borderline

DLOM

0%

no DLOM — target is listed/public (liquid equity)

Valuation summary — football field

the equity-value range each method implies; the dashed line is the company's own market value (listed targets)

How to read it. Each bar spans that method's low→high equity value; the thick tick is the central (positioned) estimate. Tight overlap across bars means the methods corroborate one another.

Company profile

who is being valued (from D&B)

Economic profile	unknown / finished_goods
Customer / export	B2B · Domestic
Industry	NAICS 2210 (sub 221)
Revenue	₹1,408 Cr (growth 89.8%)
EBITDA	₹153 Cr (margin 10.8%)
EBIT	₹151 Cr
Net debt	₹0 Cr

Confidence breakdown

six weighted signals — includes whether the methods agree, so it is not always high

Profile clarity		0.11 / 0.20
Peer coverage (effective)		0.17 / 0.20
EBITDA positive		0.10 / 0.10
Methods computed		0.10 / 0.10
Triangulation agreement		0.13 / 0.25
Comparable tightness		0.04 / 0.15

⚠ net debt unknown (borrowings/cash absent from the data source): equity assumes net debt = 0 — supply borrowings & cash to refine the bridge

Data lineage — where every number came from

each key figure traced to its exact source file and row (provenance recorded at ETL time)

FIGURE(S)	SOURCE FILE	ROW	FISCAL YR / STATUS
identity/industry/description	Basic Data.xlsx	6060	—
revenue/EBITDA/interest/depreciation/PBT/PAT	PL data.xlsx	3867	202503
net worth	Net worth.xlsx	3868	202503
total assets/net block/inventories	BS data.xlsx	3811	202503
prior-year revenue	PL data.xlsx	3868	202403
P&L reconciliation	(computed in ETL)	—	202503 · ok

⚠ **Source caveat:** Borrowings, cash and current liabilities are not in the source extract: net debt is treated as 0 with a warning, and capital employed is approximated by segment capital-employed where reported, else Net Worth.

⚠ **Source caveat:** Market prices are not in the source extract: no trading multiples — the valuation runs on the disclosed book basis until a market-price feed is added.

The filter chain — how 13,905 candidates become 15 priced peers

every screen applied between "all companies in the database" and the final peer list

Four stages. Eligibility (A) shapes the pool; knock-outs (B) reject economically different businesses outright — each with a recorded reason; similarity scoring (C) ranks survivors on five weighted dimensions; quality controls (D) decide how much each surviving peer actually influences the number.

Candidates screened (universe – target) **13,905**

Survivors **476**

15

13.02

#	FILTER	RULE	WHERE (AUDIT CODE)	PARAMETER
Stage A — Universe & eligibility				
1	Geography	Search is restricted to India (countryISOAlpha2Code = IN).	company_search request	—
2	Self-exclusion	The target's own DUNS is removed from the candidate pool.	run.py universe loop	—
Stage B — Hard knock-outs (reject before scoring)				
3	Operating model	Peer must have the SAME classified model (manufacturer / distributor / retailer / service). Rejects traders, retailers, service firms.	PEER_REJECTED	hard knock-out
4	Value chain	finished_goods vs raw_material must match — rejects raw-material suppliers (e.g. steel billets).	PEER_REJECTED	hard knock-out
5	Major industry	D&B major code must match (D=Manufacturing, F=Wholesale, G=Retail, I=Services).	PEER_REJECTED	hard knock-out
Stage C — Weighted similarity scoring (0–1)				
6	Industry proximity	1.0 same NAICS 3-digit subsector · 0.6 same Hoovers class · else 0.	similarity score	weight 0.40
7	Scale proximity	1 / (1 + log1p(rev_t) – log1p(rev_p)) — closeness of revenue on a log scale.	similarity score	weight 0.20
8	Profitability proximity	max(0, 1 – 5· margin_t – margin_p) — EBITDA-margin closeness.	similarity score	weight 0.15

#	FILTER	RULE	WHERE (AUDIT CODE)	PARAMETER
9	Customer type	B2B / B2C / mixed must match (1.0 else 0).	similarity score	weight 0.15
10	Export profile	Same exporter flag = 1.0, different = 0.3. (The ONLY trade-related filter — see note.)	similarity score	weight 0.10
Stage D — Post-scoring quality controls				
11	Top-N cut	Only the 15 highest-scoring peers enter the valuation.	compute_valuation	top_n = 15
12	Similarity weighting	Borderline peers (score < 0.85) are down-weighted, tapering to a 0.15 floor — inexact comps cannot distort the answer.	PEERS_WEIGHTED	weighted percentile
13	Multiple eligibility	Only LISTED comps with market EV feed trading multiples (book capital-employed fallback if < 3 listed); the driver must be > 0.	FALLBACK_BOOK_EV	per method
14	Outlier trim	Tukey fence: multiples outside [Q1–1.5·IQR, Q3+1.5·IQR] are dropped.	METHOD_COMPUTED	1.5 × IQR
15	Scale-mismatch penalty	Target outside the peer revenue band → all multiples adjusted (–7.5% per log-decade below the band, capped 15%; +5%/decade above, capped 10%). The explicit penalty for 'no exact-size peer exists'.	COMPARABILITY_ADJUSTMENT	disclosed ± %

What is NOT used: import data and per-capita metrics are not part of the calculation — they are not in the D&B financial payload. The only trade-related signal is the **export flag** (filter 10). Everything above is the complete list.

What the chain guarantees (can never happen): a peer with a different operating model, value chain or major industry reaching the valuation · a single outlier multiple moving the answer · borderline comps dominating (weights taper to a 0.15 floor and the range widens on the effective count) · a size-mismatched peer set silently inflating a small company's value · a fabricated number when nothing survives — the answer is honestly "none" with the audit trail explaining why.

What it cannot guarantee: filters compare what the data contains — a misdescribed company misclassifies *visibly* (in the audit trail), not silently · industry codes approximate product overlap, they don't

prove it · on the real extract, multiples are book-basis (no market prices in the source) with disclosed caveats · precedent transactions are derived from a control premium, not observed deals.

Rejected this run (13,429 total, first 50 shown — full counts by check in the audit trail)

Comparable companies (15 of 476 ranked)

one detail card per peer — match confidence, every check it passed, all five similarity dimensions, and its multiples

Match confidence is the 5-dimension similarity score (industry 40% · scale 20% · margin 15% · customer 15% · export 10%). Every peer below already survived the hard knock-outs — a company with a different operating model, value chain or major industry can never appear here. **Weight** is how much the peer's multiple counts: full matches (≥ 85%) count fully, borderline comps taper toward a 0.15 floor so they cannot distort the valuation.

Valuation methods — triangulation

the same company valued three independent ways

Recipe per method. Take listed comps' multiples → drop statistical outliers (Tukey 1.5×IQR) → read the multiple at the target's **quality position** (its EBITDA-margin percentile among peers, so a weaker business earns a lower multiple) using similarity weights → × the target's driver = enterprise value → – net debt → – DLOM (private targets only) = equity. A spread across methods is informative, not an error.

METHOD	BASIS	COMPS	OUTLIERS CUT	MULTIPLE LOW/POS/HIGH	DRIVER	EV (MID)	EQUITY LOW-MID- HIGH
EV/EBITDA ★	sector- calibrated	14 (eff 12.2)	1	6.87 / 8.40 / 18.67	₹153 Cr	₹1,281 Cr	₹1,049 Cr – ₹1,281 Cr – ₹2,849 Cr
EV/Revenue	sector- calibrated	13 (eff 11.4)	2	1.14 / 1.27 / 1.39	₹1,408 Cr	₹1,790 Cr	₹1,600 Cr – ₹1,790 Cr – ₹1,960 Cr
EV/EBIT	sector- calibrated	15 (eff 13.0)	0	8.95 / 10.90 / 22.89	₹151 Cr	₹1,641 Cr	₹1,347 Cr – ₹1,641 Cr – ₹3,446 Cr

Equity bridge (headline). EV/EBITDA 8.40x × ₹153 Cr = EV ₹1,281 Cr – net debt ₹0 Cr – DLOM 0% = **equity ₹1,281 Cr**

✓ **Comparability check — no scale mismatch.** Target revenue ₹1,408 Cr sits inside the peer band (₹132 Cr – ₹2,362 Cr), so no size adjustment was needed.

Comparable-transactions view (indicative) — what a control buyer might pay: ₹1,258 Cr – ₹1,602 Cr – ₹3,704 Cr.

Theory. The headline range above is a MINORITY trading value. Acquirers of control pay a premium (control of cash flows, synergies) — empirical studies cluster at **20–30%**. Indicative only — what a CONTROL buyer might pay relative to the minority trading value above. Replace with observed precedent-transaction multiples when a deal database is integrated.

Positioning. target EBITDA margin 10.8% ranks at the 47th percentile of the peer set → central multiple taken at peer P47 (not the flat median).

Range basis. positioned at margin P47 (band P27–P67) · **EV basis.** Primary basis: market enterprise value (market cap + net debt) of 0 LISTED comparables. Book capital-employed proxy (15 unlisted comps) is used only as a per-method fallback when fewer than 3 listed comps exist for a metric. Peer multiples are similarity-weighted (borderline comps count less). Multiples are sector-calibrated — peer book distributions re-levelled to published trading anchors (sector 'constr' trading anchors: ev/ebitda 9.0x · ev/sales 1.3x · ev/ebit 11.2x, size

factor $\times 1.0$ (india sector aggregates, jan-2025 calibration defaults)); replace the anchor table with a live market feed for exact levels.

Methodology validation — is it accurate in general, or just here?

every listed company in the universe is re-valued from its peers and compared to its OWN market cap

Why this matters. One good calibration can be luck. This backtest re-values **every** listed comparable and measures the error against real market value — and the method must beat the naive "just use the median" baseline across the board, not just on the demo company.

APPROACH	MEAN ERR	MEDIAN ERR	MAX ERR	WITHIN 15%
Quality-positioned + weighted (used)	8.3%	7.5%	26.1%	28/32
Flat median (naive baseline)	10.5%	8.3%	36.9%	23/32

✓ **VERDICT: PASS** — $\text{corr}(\text{margin}, \text{EV/EBITDA}) = 0.487$; positioning closer on 24/32 targets. Positioning never sees the market cap it is checked against.

Seed-robustness — 5 freshly drawn universes

The same backtest re-run on universes generated with different random seeds (different financials, listings, market noise). If positioning only won on the canonical universe, it was seed-luck.

Audit Trail

every D&B call and engine decision — typed, ordered, replayable
